Labcorp’s allergen profiles use ImmunoCAP™ specific IgE allergy testing, the “gold standard” for allergy blood testing.¹ Specific IgE test results can help support an allergy diagnosis, determine sensitization and/or help rule out allergy altogether.

Ruling out allergic sensitization may reduce worry and unnecessary medication. These tests can help with trigger avoidance, tailored education, management considerations and appropriate referrals.²

Labcorp’s policy is to provide physicians, in each instance, with the flexibility to choose appropriate tests to assure that the convenience of ordering test combinations/profiles does not prevent physicians who wish to order a test combination/profile from making deliberate informed decisions regarding which tests are medically necessary. All the tests offered in test combinations/profiles may be ordered individually using the Labcorp test request form.

Regional Respiratory Profile With Pet Allergen Component Reflex

Pet Allergen Component Reflex Testing—For Enhanced Management

- Labcorp's area-specific respiratory profiles with pet allergen component reflex include the most common categories of pollens (e.g., grass, trees and weeds) per region and indoor allergens including mold, dust mites, insect emanations and pet components.³
- Automatic reflex testing to cat and dog pet allergen components occurs when the whole allergen test indicates sensitization to an allergen.
- Risk for and severity of respiratory diseases increases with the number of pet allergen components to which a person is sensitized. The pet allergen reflex provides a clearer picture of a person's allergic sensitization pattern at the component level and can help enhance management strategies.^{4,5,6}

Food Allergy Profiles with Component Reflex Testing

Quantitative Allergen-specific IgE tests performed using the Thermo Fisher ImmunoCAP® method

Food Allergen Profiles:

Labcorp's food allergen profiles include the top nine food groups that cause the majority of reactions:

- Egg
- Peanut
- Soy
- Fish
- Sesame
- Tree Nuts
- Milk
- Shellfish
- Wheat

Automatic Reflex:

- When the whole allergen test is positive, it will automatically reflex test milk, egg, peanut and/or tree nut components. This helps to identify a person's risk for a systemic reaction versus a milder or more localized response and allow for a comprehensive management plan.⁷

Food Component Profiles:

Specially Designed Profiles For Young Children

Labcorp offers age specific profiles and respiratory and food component reflex panels to help assess allergen sensitivity in young children. Specific IgE testing can be useful in assessing the potential that an atopic disposition might play in fostering chronic sinusitis, dermatitis and potentially asthma, thereby allowing the clinician to develop an optimal therapeutic approach at an early age.
